Outline

- Introduction
- CMOS process and characterization
- Low frequency (LF) noise measurements at room & low temperature and physical models
- Compact modeling of LF noise with EKV3
- Conclusion

Introduction: aim of this work

- **Design of hybrid CMOS read-out circuits for night vision using high performance infrared (IR) detectors**
- **IR detectors and CMOS circuits cooled down to 77 K**
- **Difficulties: low temperature (LT) & analog circuits (weak/moderate inversion)**
- **IC design with 0.8, 0.5 and 0.35 µm CMOS and circuit simulation with the EKV2.6 compact model**
- **More and more transistors in the pixel, need for more and more advanced CMOS processes**
- **0.18 µm process: new effects, e.g. INWE (STI), DITS (pockets)**
- **EKV3 is an accurate compact model for LT analog circuits design, Cryogenics, in press, 2009**
- **This work: evaluation of the EKV3 LF noise model**

CMOS process

- Commercial process for Analog / Digital / RF applications
- Not optimized for LT operation
- Dual gate:
  - ✓ 0.18 µm - 1.8 V - Tox=3.3 nm
  - ✓ 0.35 µm - 3.3 V - Tox=6.5 nm
- Multi-Vt: standard (STD), low Vth (LVT), zero Vth (ZVT)
- Triple well
- Twelve MOSFET

DC characterization and LFN measurements

DC characterization

- **1st step before LF noise measurements**
- **Standard and specific effects**
- **Id, Gm, Gmb, Gds**
- **Temperature range: 77 K - 300 K**

LF noise measurements

- **Automatic current fluctuations meas. on up to 6 devices inside a cryostat**
- **Specific computer-controlled system with programmable biasing amplifiers**
- **Transistors biased in saturation: Vds=VDD as in analog circuits**
- **L=Lmin - 20 µm ; W=Wmin - 20 µm**
- **$1/f^{\gamma}$ noise with $\gamma = 1.0 \pm 0.1$**

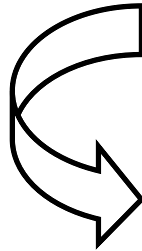
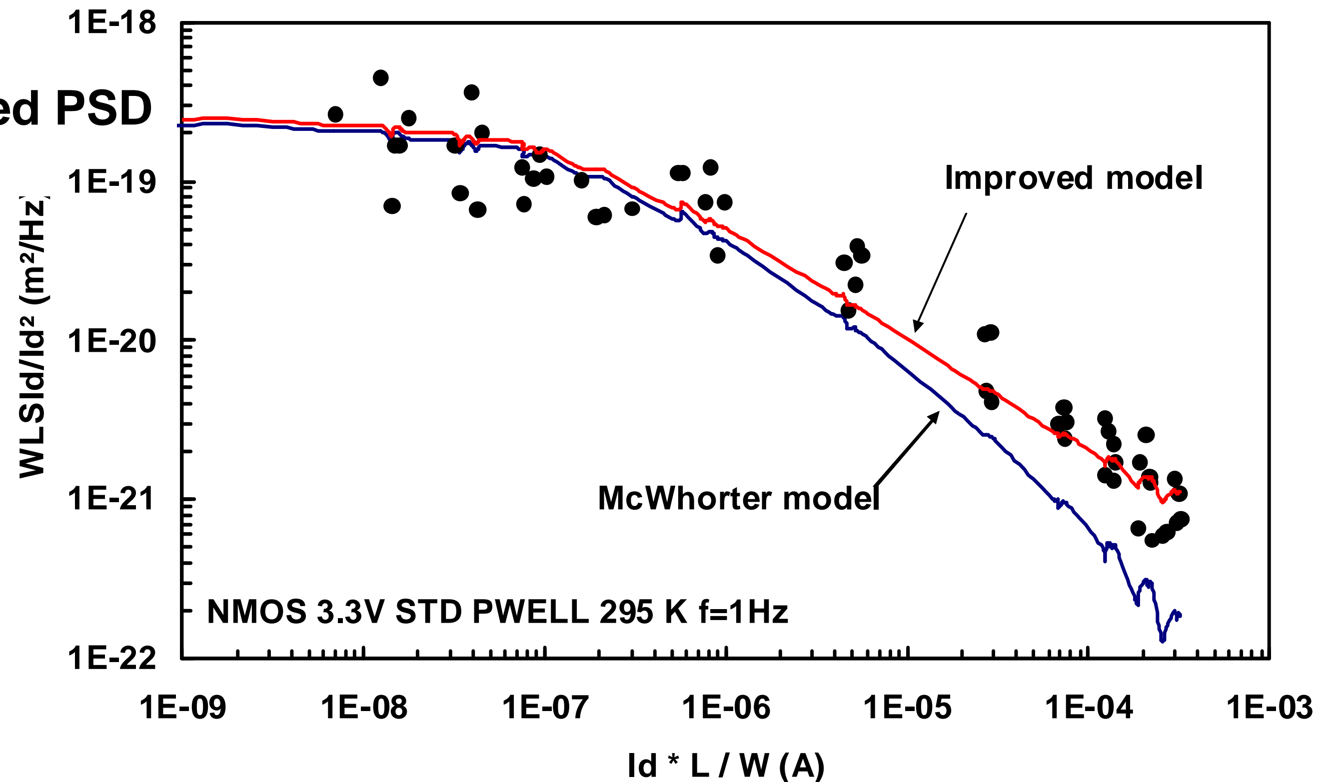
Noise measurements at room temperature: Hooge, standard or improved McWhorter's model?

Normalized PSD





NMOSFET 3.3 V
295 K

- Plateau in weak inversion: Hooge mobility fluctuation model not applicable
- McWhorter's carrier number model applicable, but has to be improved in strong inversion
- Same model applies experimentally for PMOSFET

© CEA 2009. All rights reserved. Any reproduction in whole or in part on any medium or use of the information contained herein is prohibited without the prior written consent of CEA

The improved McWhorter's LF noise model

1 - Standard McWhorter carrier number fluctuations (ΔN)

$$SI_d = [1 + \alpha \mu C_{ox} \frac{I_d}{G_m}]^2 G_m^2 S_{Vfb}(f)$$

[A²/Hz]

2 - Correlated mobility fluctuations (Δµ) at high current

$$S_{Vfb}(f) = \frac{kT q^2 \lambda N_t(E_F)}{WL C_{ox}^2} \frac{1}{f^\gamma}$$

[V²/Hz]

S_{Vfb}: flat-band voltage fluctuations

N_t: oxide trap volume density per unit energy at E_F (eV^{-1} cm^{-3})

λ: tunnel attenuation distance (0.1 nm)

α: Coulomb scattering coefficient at RT (V s/C) ~ 10^4 for electrons, 10^5 for holes

(3.3 V STD n-MOSFETs: $\alpha=7\times10^3$ at 295 K)

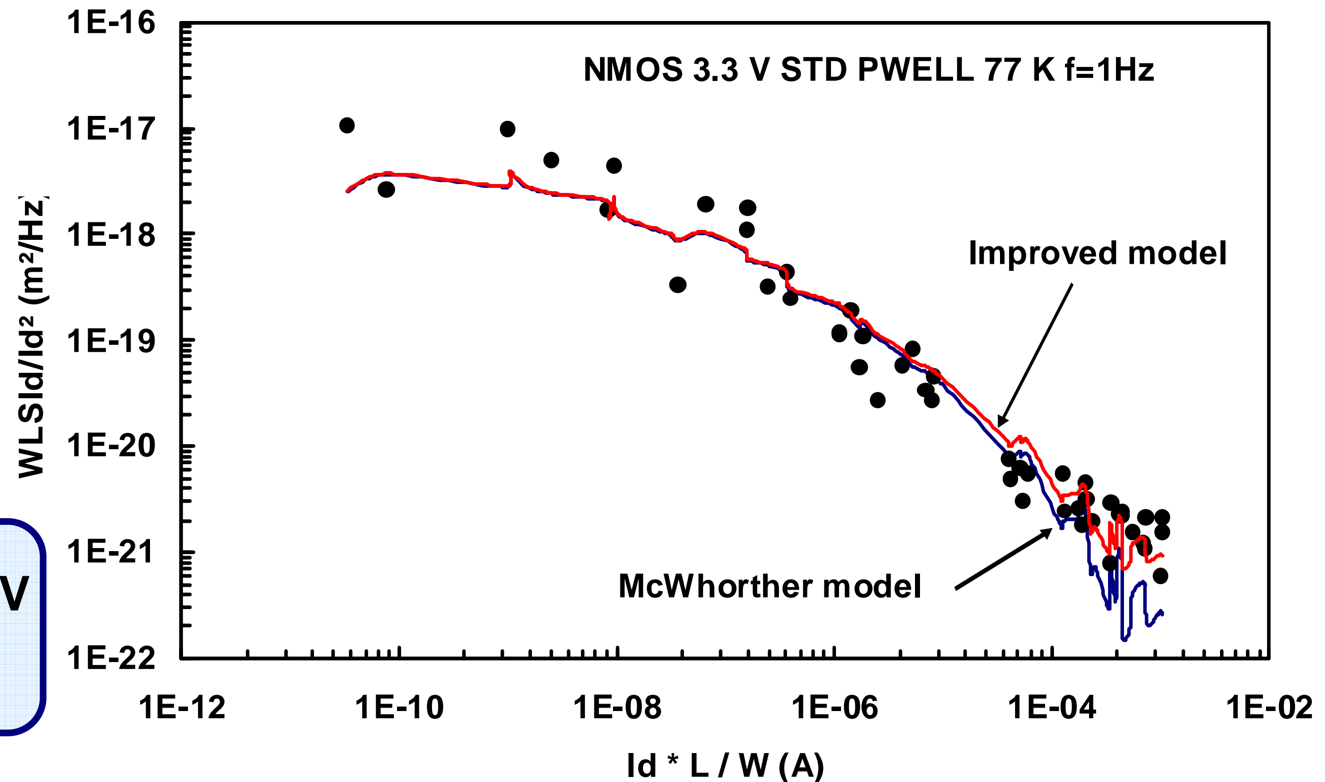
Noise measurements at 77 K

NMOSFET 3.3 V
77 K



- Improved McWhorter's model still applicable at low temperature
- Lower α Coulomb scattering coefficient at LT (9×10^2 at 77 K)
- Same result for PMOSFET, but different Coulomb scattering coefficient

LFN model in EKV2.6 and EKV3

in EKV2.6:

$$S_{Id} = \frac{KF\,G_m^2}{C_{ox}\,W_{eff}\,L_{eff}\,f^{AF}}$$

in EKV3:

$$S_{Id} = \frac{KF\,G_m^{EF}}{C_{ox}\,W_{eff}\,L_{eff}\,f^{AF}}$$

Three parameters: KF, AF, EF ≠ 2

- Only Gm, the gate transconductance
- Simple but efficient model? Valid only in weak inversion? Also valid in moderate and strong inversion?

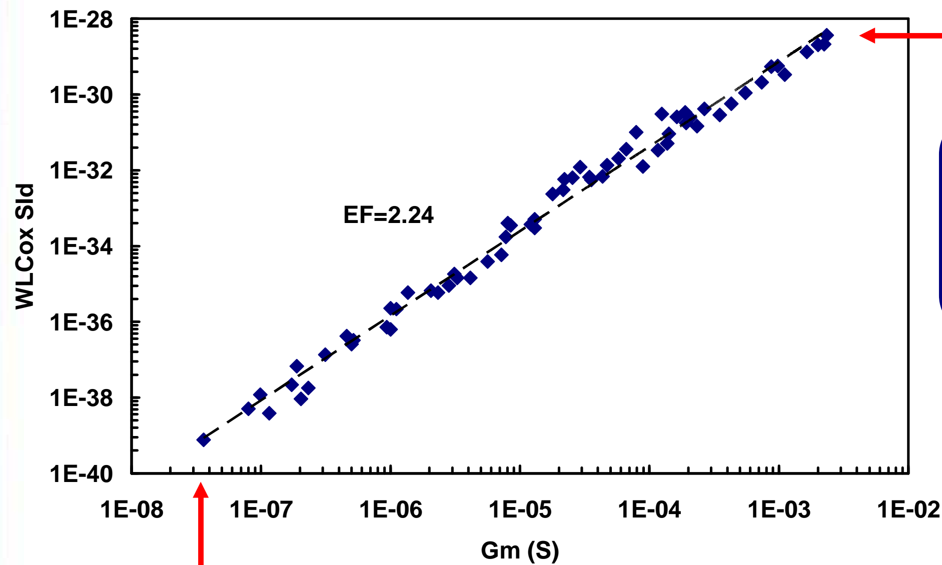
Test of the EKV3 LFN model at RT

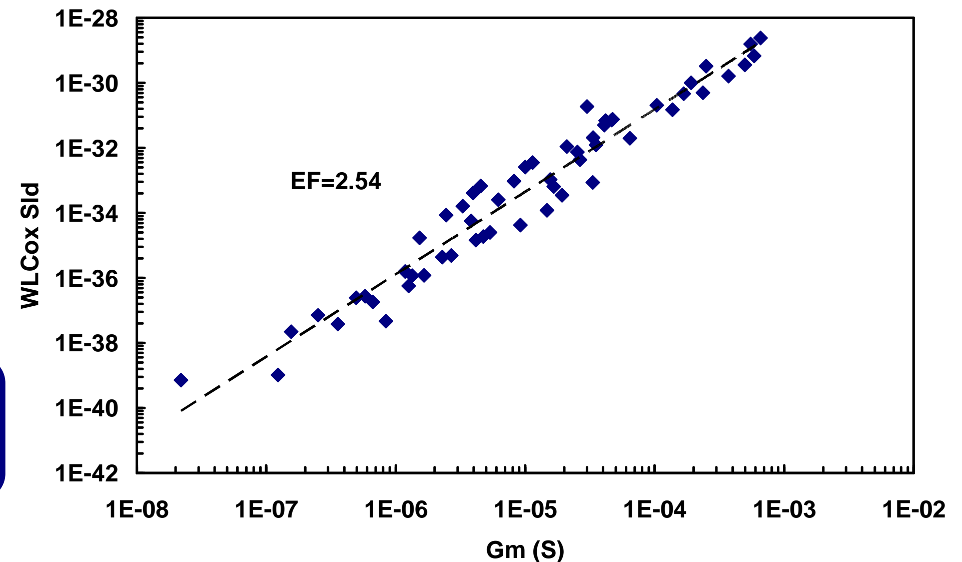


strong inversion

NMOSFET STD 3.3 V P-WELL

Tox=6.5 nm f=1 Hz

weak inversion



PMOSFET STD 3.3 V N-WELL

Conclusion

- **Measurements of LFN in a 0.18 μm mixed-mode / RF CMOS process at room and low temperature**
- **1/f noise is well described by the ΔN - Δμ (improved McWhorter's) model**
- **The Coulomb scattering coefficient is lower at 77 K than at RT**
- **The LF noise model implemented in EKV3 is simple but valid at low temperature in a very wide range of inversion: weak, moderate and strong inversion**
- **Measured EF parameter values are <> 2 and are device- and technology-dependent**
